

PHENPHITCHA PHAISAN

SOFTWARE TESTER INTERN

+66 82 619 1349 | phenphitcha4848@gmail.com | github.com/PhenphitchaPhs

SUMMARY

I am a Software Engineering student. I care about software quality. I can write test cases from requirements and Figma designs. I run manual and automated tests with Playwright, Robot Framework, and Selenium. I write clear bug reports with steps to reproduce each problem. I can read and write code in TypeScript, Python, and Vue 3. This helps me find the real cause of a bug, not just the symptom on the screen. I am looking for a Software Tester internship. I want to learn how a real QA team works and help the team deliver software that works well.

SKILLS

Testing: Manual Testing, Test Case Design (Equivalence Partitioning & Boundary Value Analysis), E2E Testing, API Testing, UI Testing

Automation Tools: Playwright, Robot Framework, Selenium, Postman

Development: TypeScript, JavaScript, Python, Vue 3, Hono, SQL, REST API

Platforms & Tools: GitHub, GitHub Actions (CI/CD), Cloudflare D1, Figma

Concepts: SDLC & STLC, Bug Tracking, Version Control

Soft Skills: High Attention to Detail, Analytical & Problem-Solving, Effective Communication, Team Collaboration

EDUCATION

University of Phayao

2024 – Present

Bachelor of Engineering in Software Engineering | GPA: 3.20

PROJECTS & TESTING EXPERIENCE

End-to-End Testing with Playwright *(Advanced Software Testing)*

University of Phayao

- I wrote automated end-to-end tests with Playwright for two websites (SauceDemo and a Coffee Shop site). I put each website's tests in its own .spec.ts file.
- SauceDemo: I automated the guest checkout process. I also turned 3 test cases from a test document into working test scripts.
- Coffee Shop: I designed and automated 3 more test cases.

Software Testing Design — Test Case Documentation *(Student Project Collaboration)*

University of Phayao

- I wrote 31 test cases for 5 main features (login/register, notifications, billing, maintenance, and room management) of a dormitory management system. I used the Figma design before the developers started coding.
- I used Equivalence Partitioning and Boundary Value Analysis to prepare valid and invalid test data, pre-requisites, and expected results for each test case.
- I updated the test cases 3 times to add missing cases and make each step clearer.

Automated Testing with Robot Framework *(AI-assisted)*

University of Phayao

- I planned the test scenarios — which pages and user actions to test — for the university's student registration system.
- I used AI tools to generate the Robot Framework and Selenium scripts. Then I ran the tests, checked the results, and took screenshots as proof.

OR-Room — Surgery Queue Management System *(Team project, ongoing)*

project-or-room.vercel.app

- I was the only backend developer (Hono, Cloudflare D1). I built role-based login and automatic patient queue sorting. I also built about 30–40% of the frontend with Vue 3 and TypeScript.
- I manually tested new features on the live system to find and fix bugs before we delivered them.
- I set up GitHub Actions for continuous integration (CI).

Automated Testing — E-Commerce Practice Website *(Individual Quiz Assignment)*

University of Phayao

- I wrote 3 automated test cases with Playwright for a practice e-commerce website (practicesoftwaretesting.com).
- Test 1: search for a product by keyword and check that every result matches the keyword.
- Test 2: add a product to the cart, check the cart quantity and total price, then go to the checkout page.
- Test 3: check the password validation on the registration form and confirm the error message appears.
- I took screenshots at each step as evidence.
